One of the most extensive fracture classification studies ever compiled

This second edition features an in-depth review of a much larger sample size in a nationwide study on fracture incidence. All fractures are classified according to the widely accepted AO/OTA system for immediate recognition and analysis. Anatomic diagrams, illustrations, MRI and CT images, and X-rays clearly demonstrate how the AO/OTA fracture classification and coding system works. Not only will readers get a full statistical overview of fracture location, segment, and type, but they will also learn key demographic data such as age, gender, and incidence rate. This book offers a wealth of information that will impact treatment planning, future allocation of resources in trauma care, and initiatives in preventive medicine.
