One of the most important elements in the new ABR Core and ABR Certifying Exam is the emphasis placed on noninterpretive skills in radiology. These skill sets comprise all those elements of radiology not directly related to radiologic diagnosis, and include radiation and patient safety, information on contrast agents, error prevention, patient communication, quality control, critical thinking, professionalism, ethics, and so on. The exam devotes an entire “module” is devoted to these questions. This resource helps diagnosis-focused radiologists work on the rest of their practice.

The second edition of this practical guide provides a thorough introduction to the essential concepts of clinical neurology. Central to the book are the lucid structuring of complex contents allowing efficient learning, even without prior knowledge of the subject, and the vital link between theory and clinical practice, with essential information on history-taking, the clinical examination, and additional tests, all supported by informative graphics and appropriate computed tomography or magnetic resonance imaging studies.
In training to become a neurosurgeon, many of the crucial manual skills that must be acquired can only be mastered through growing experience during the rigorous and lengthy training process. Yet, many - often essential - practical skills can quickly be learned, practiced, and even mastered, away from the OR. The author’s motivation for writing this guide arose during his own training and his need for just such a practical aid. *Getting Ready for Brain Surgery* provides the readers with a basic set of exercises that will allow him to develop and improve their motor skills, handling of various tissues, and general technical competence. Detailed instructions are given in the illustrated text and in accompanying videos.
As grueling as medical studies and training are, with appropriate discipline and time management it is possible to stay afloat, maintain one's sanity, achieve one's goals, and still enjoy a fulfilling life. It is the purpose of this book to stimulate thought processes that nurture a healthy attitude toward organizing one's time and life so as to improve one's own quality of life as well as the patient's well-being.

**DESCRIPTION**
Authored by two world-renowned pioneers in the field of spinal surgery, this book covers the range of spinal deformities—emphasizing scoliosis—and their etiologies, including idiopathic, congenital, neuromuscular, tumors, neurofibromatosis, and more. All too often in other works, too much attention has been focused on how to put in metalwork, without sufficiently discussing the what, when, and why. Authors Dickson and Harms provide a wealth of knowledge through experience that shows how important newer therapeutic concepts and surgical methods are, such that beyond just preventing the progression of deformity, it is now possible, with correctly performed surgery, to eliminate deformity and straighten spines permanently.

**SALES HOOKS**
- Major new text in spinal deformity surgery, reflecting essential and evidence-based principles and practice
- Information on new techniques, including anterior approach to the spine and techniques for children to prevent spine deformities
- Dickson and Harms are two of the most experienced names in European spine surgery

The field of N-heterocyclic carbenes, whether in transition-metal catalysis or organocatalysis, is rapidly evolving towards applications, but is also still very active on the catalyst development front. The number of applications found in synthesis in academia and in industrial settings continues to grow. Significant advances have been made over the past two decades and the development of these reactions has dramatically improved the efficiency of organic synthesis. N-Heterocyclic carbene based catalysts are now commonly used, and are widely applied in the area of synthesis of both natural products and therapeutic agents. Science of Synthesis: N-Heterocyclic Carbenes in Catalytic Organic Synthesis presents the most commonly used and significant metal- or non-metal-catalyzed reactions for modern organic synthesis. The basic principles and current state-of-the-art of the well-established methods are covered. Scope, limitations, and mechanism of these reactions are discussed and key experimental procedures are included. Typical examples of target synthesis are often provided to show the utility and inspire further applications.

Contents Overview

- N-heterocyclic Carbenes
- Metal Complexes
- Cross Coupling
- Metathesis
- Polymerization
- Addition Reactions
- Cyclization
- Asymmetric Catalysis
- Recyclable catalysts
These two SOS volumes present the broad scope of metal-catalyzed reactions for the synthesis of cyclic compounds, from long-established methods to state-of-the-art approaches. The power of these reactions is highlighted by selected examples of application in natural product/drug synthesis.

Significant advances in metal-catalyzed cyclizations have dramatically improved the efficiency of organic synthesis. "Science of Synthesis: Metal-Catalyzed Cyclization Reactions" presents the most commonly used and significant metal-catalyzed reactions for modern organic synthesis. The basic principles, the current state of the art, scope, limitations, and mechanism of these reactions are also discussed and selected experimental procedures are included. Typical examples of target synthesis are provided to help inspire further applications.

Volume 1 covers intramolecular coupling reactions (including Heck reactions), intramolecular allylations, and cyclopropane and cyclopropene ring openings. Also included are cyclization reactions of alkenes, alkynes, and allenes, cycloisomerizations, and intramolecular C-N and C-O bond formation.

Volume 2 covers epoxidations, aziridinations, cyclopropanations, and Pauson-Khand reactions, as well as a wide range of cycloaddition processes, radical cyclizations, and ring-closing metathesis.

SALES HOOKS

- Comprehensive coverage of a dynamic field which is of great interest to the synthetic organic chemist.
- Some of the most significant and practical metal-catalyzed reactions for modern organic synthesis are presented having been carefully selected by the volume editors.
- Experimental procedures that would not otherwise be easily available are included.
